Project 2: Modelling daily cycling demand in Edinburgh

Group members: Alice Miller, Saba Sitter, Jake Saunders

Word count: [XXX words]

1 Introduction

The "cycle daily" dataset consists of approximately 2,180 daily observations ranging from 2020 to 2025, sourced from Edinburgh's network of automatic cycling counters, along with local weather and temporal data. This data comes from sensors at specific locations across the city, so it's possible not every cyclist is accounted for. However, they are a good indicator of how cycling demand varies across different days and weather patterns. Edinburgh relies heavily on public transport for its residents and tourists to navigate the city. For future funding allocation and planning, it is important to know how many cyclists are on the road in order to evaluate whether the infrastructure (cycle lanes, crossings etc) and investment in schemes (rentable Voi bikes) need to adapt to meet demand. The modelling goal is to develop a sequence of increasingly complex linear regression models to isolate how temporal and weather variables, such as the day of the week and the temperature, influence cycling demand. Ultimately, the goal is to extrapolate cycling demand to the future so that Edinburgh City Council and Transport Scotland can optimise infrastructure investment over the next decade to align with their active travel priorities.

2 Exploratory data analysis

To begin investigating the impact of weather on the number of daily cyclists, we begun with some exploratory data analysis. Table 1 displays the summary statistics for the weather data and number of daily cyclists is as follows:

2.1 Summary Statistics table for count, temp_mean, temp_min, temp_max

Table 1: Summary Statistics for count, temp mean, temp min, temp max

Variable	Mean	SD	Min	Max
count	10815.47	4728.88	1264.00	43864.00
temp_mean	9.69	4.79	-8.08	22.96
temp_min	5.92	4.98	-14.00	18.00
temp_max	13.15	5.31	-3.00	31.00

We can see that the number of daily cyclists varies from $1,264$ to $43,864$, an increase of $\approx 3470\%$, and the variation is very high. Intuitively, one would think that a warmer average weather would lead to more cyclists.

We then plotted a time series of the daily cyclist count from 2020 to 2025.

2.2 Time series of daily counts 2020-2025 with a smoother.

Figure 1: Time series of daily counts 2020-2025 with a smoother

We can see from figure 1 that there are yearly fluctuations, with peaks and troughs occuring yearly. Overall, the cyclist count seems to be decreasing. There is a visible peak in 2022, which we investigate. We then created boxplots of the daily cyclist count by month and by the day of week.

2.3 Boxplots of count by month and by day of week.

Figure 2: Boxplots of count by month and by day of week

We can see from figure 2 that the winter months have slightly lower cyclist counts, with the other months remaining relatively constant. This indicates that the month does not have a tremendous impact on the number of daily cyclists outside of January and December. From the second boxplot, there appear to be less cyclists on Mondays and Sundays, with the other days again appearing relatively constant.

2.4 Scatter plot of count vs temp_mean.

Figure 3: Scatter plot of count vs temperature mean

Figure 3 shows a scatter plot of daily counts vs the mean temperature for that day, with the red line being the regression line. There is a general trend as the temperature increases, so does the daily count which is as expected.

2.5 Extra Plots

Figure 4 shows for each month a boxplot for the different day types (weekends or weekdays). Generally the medians tend to be higher for the weekdays across all the months, but by varying amounts. June and Novemeber seems to have the biggest variance between the two days types

3 Baseline model M0

4 Proposed models M1–M3

4.1 Model M1: Trend and factor

4.2 Model M2: Nonlinear temperature

4.3 Model M3: [your extension title]

5 Evaluation

5.1 Statistical Performance

5.2 Practical Performance

6 Discussion and limitations

7 Appendix: Code

All analysis code is in `code.R` and is reproduced below.
